# Problem 1

Note that from the hint, we can see that the Dirichlet distribution is a distributed beta, so all the lecture theorems apply.

$$P(X[M+1] = x^{i} \mid D)$$

$$= \int_{\theta} P(X[M+1] = x^{i} \mid \theta) * P(\theta \mid D) d\theta$$

$$= \int_{\theta} \theta_{i} * P(\theta \mid D) d\theta$$

$$= E_{\theta \mid D}[\theta_{i}] = \frac{\alpha_{i} + M[i]}{M + \alpha}$$

with the last equality taken straight from lecture notes and naturally results from the conjugate distribution with Dirichelet.

# 1.2

$$\begin{split} &P(X[M+1] = x^i, X[M+2] = x^j \mid D) \\ &= &P(X[M+1] = x^i \mid D) * P(X[M+2] = x^i \mid X[M+1] = x^j, D) \end{split}$$

But notice, the second part, is just augmenting the data set by one more example. Thus, our probabilities are just

$$\frac{\alpha_i + M[i]}{M + \alpha} * \frac{\alpha_j + M[j] + 1(i = j)}{M + \alpha + 1}$$

$$\begin{split} &P(X[M+1] = x^i, X[M+2] = x^j \mid D) \\ &/P(X[M+1] = x^i \mid D) * P(X[M+2] = x^i \mid D) \\ &= & (\frac{\alpha_i + M[i]}{M + \alpha} * \frac{\alpha_j + M[j] + 1(i = j)}{M + \alpha + 1}) / (\frac{\alpha_i + M[i]}{M + \alpha} * \frac{\alpha_j + M[j]}{M + \alpha}) \\ &= & \frac{(\alpha_j + M[j] + 1(i = j))}{(\alpha_j + M[j])} * \frac{(M + \alpha + 1))}{(M + \alpha)} \end{split}$$

The difference here is if you update your Dirichlet counts after you sample the M+1th sample when you do exact inference and don't if you do approximate. Thus, if your data set is large, then not updating doesn't matter, but if it is small it might make a large difference.

With the function above, both factors of the product clearly have the +1 become irrelevant as M goes to infinity and dwarfs it.

### Problem 2

Let T be the total number of examples.

$$\pi = \sum_{ij} \frac{1[Z_{ij} = 1]}{T} = 0.57$$

$$\mu_0 = \sum_{ij} \frac{1[Z_{ij} = 0] * X_{ij}}{1[Z = 0]} = [-0.99437209, -1.11730233]$$

$$\mu_1 = \sum_{ij} \frac{1[Z_{ij} = 1] * X_{ij}}{1[Z = 1]} = [1.04922807, 0.98085965]$$

$$\sigma_0 = \sum_{ij} \frac{1[Z_{ij} = 0] * (X_{ij} - \mu_0)(X_{ij} - \mu_0)^T}{1[Z = 0]} = [[0.30811884, 0.28553768][0.28553768, 0.81346635]]$$

$$\sigma_1 = \sum_{ij} \frac{1[Z_{ij} = 1] * (X_{ij} - \mu_1)(X_{ij} - \mu_1)^T}{1[Z = 1]} = [[0.77827888, 0.19683566][0.19683566, 0.24996938]]$$

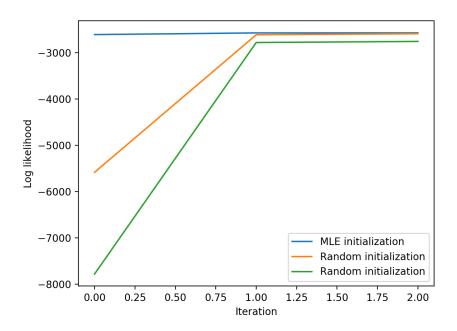

Figure 1: Log likelihood functions

#### MLE start:

```
{'pi': 0.58616150703175707, 'sigma_1': matrix([[ 0.72112418,  0.14499114],
[ 0.14499114, 0.30825171]]), 'sigma_0': matrix([[ 0.36212646, 0.31082931],
[ 0.31082931, 0.75836101]]),
'mu_1': matrix([[ 0.98729587, 0.99618266]]),
'mu_0': matrix([[-1.04406391, -1.02551825]])}
Random 1 start:
{'pi': 0.51535490062201894, 'sigma_1': matrix([[ 0.5953022 ,  0.54367732],
[ 0.54367732, 1.01903159]]), 'sigma_0': matrix([[ 0.6061935 , 0.05204946],
[ 0.05204946, 0.24784284]]), \\ 'mu_1': matrix([[-0.80990003, -0.72964472]]),
'mu_0': matrix([[ 1.16379378,  1.10503744]])}
Random 2 start:
{'pi': 0.18461282486659261, 'sigma_1': matrix([[ 1.66246823,  1.30203827],
[ 1.30203827, 1.3425169 ]]), 'sigma_0': matrix([[ 1.31417998, 1.17278467],
[ 1.17278467, 1.51739247]]), \\ 'mu_1': matrix([[ 1.07480467,
                                                                0.22227733]]),
'mu_0': matrix([[-0.06350569, 0.14531717]])}
```

One of the random starts seems to have found approximately the same maxima that MLE found, but the other one ended up in a slightly worse local minimum.

#### 2.B1

See part 2.A1 for other formulas

$$\phi = \sum_{i} \frac{1[Y_i = 1]}{N} = 0.6$$

$$\lambda = \sum_{ij} \frac{1[Z_{ij} = Y_i]}{M * N} = .93$$

For a given precinct

$$\sum_{D} \log P(X_{1...M}) = \sum_{D} \log \sum_{Y} \sum_{Z} P(X_{1...M}, Y, Z_{1...M})$$

$$= \sum_{D} \log \sum_{Y} P(Y) \prod_{j=1...M} \sum_{Z_{j}} P(Z_{j} \mid Y) * P(X_{j} \mid Z_{j})$$

$$= \sum_{D} \log \sum_{Y} P(Y) \prod_{j=1...M} \sum_{Z_{j}} P(Z_{j} \mid Y) * P(X_{j} \mid Z_{j})$$

Where

$$P(Y = 1) = \phi$$

$$P(Z_j \mid Y) = 1(Z = Y) * \lambda + 1(Z \neq Y) * (1 - \lambda)$$

$$P(X_j \mid Z_j) = N(X \mid \mu_{Z_j}, \sigma_{Z_j})$$

# 2.B2

$$\begin{split} &P(Y_i = 1 \mid X_{i,1...M}) \\ &= \frac{\sum_{Z} P(Y_i = 1, Z, X_{i,1...M})}{P(X_{i,1...M})} \\ &= \frac{P(Y_i = 1) \sum_{z_i,1...M} \prod_{j=1}^{M} p(x_{ij} \mid z_{ij}) * p(z_{ij} \mid y_{ij})}{P(X_{i,1...M})} \\ &= \frac{P(Y_i = 1) \prod_{j=1}^{M} \sum_{z_i,1...M} p(x_{ij} \mid z_{ij}) * p(z_{ij} \mid y_{ij})}{P(X_{i,1...M})} \\ &= \frac{P(Y_i = 1) \prod_{j=1}^{M} \sum_{z_i,1...M} p(x_{ij} \mid z_{ij}) * p(z_{ij} \mid y_{ij})}{\sum_{y} P(Y_i = y) \prod_{j=1}^{M} \sum_{z_i,1...M} p(x_{ij} \mid z_{ij}) * p(z_{ij} \mid y_{ij})} \end{split}$$

And this last part is polynomial to calculate not exponential because we pushed the sum into the product so we can calculate the Z's independently (we can see they are independent from the Bayesian tree)

Since everything is indexed by i and precinct specific, for this derivation I will just drop the i and only refer to the j index (if necessary).

$$\begin{split} &P(Z_{j} = 1 \mid X_{1} \dots M) \\ &= \frac{\sum_{Z_{-j}} \sum_{Y} P(Y, Z_{1 \dots M}, X_{1 \dots M})}{P(X_{1 \dots M})} \\ &= \frac{\sum_{Y} P(Y) p(x_{j} \mid z_{j}) * p(z_{j} \mid y_{j}) \sum_{Z_{-j}} \prod_{-j} p(x_{j} \mid z_{j}) * p(z_{j} \mid y_{j})}{P(X_{1 \dots M})} \\ &= \frac{\sum_{Y} P(Y) p(x_{j} \mid z_{j}) * p(z_{j} \mid y_{j}) \prod_{-j} \sum_{Z_{-j}} p(x_{j} \mid z_{j}) * p(z_{j} \mid y_{j})}{P(X_{1 \dots M})} \\ &= \frac{\sum_{Y} P(Y) p(x_{j} \mid z_{j}) * p(z_{j} \mid y_{j}) \prod_{-j} \sum_{Z_{-j}} p(x_{j} \mid z_{j}) * p(z_{j} \mid y_{j})}{\sum_{Y} P(Y) \prod_{Z} \sum_{Z} p(x_{j} \mid z_{j}) * p(z_{j} \mid y_{j})} \end{split}$$

Where this, like the equation above is polynomial and not exponential as desired because we pushed in the sums.

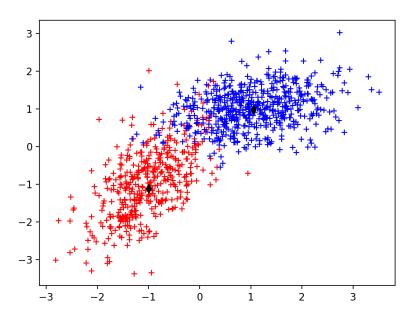

Figure 2: Scatter plot with MLE estimation

# 2B3

Log likelihood:

For a given precinct

$$\sum_{D} \log \sum_{Y} P(Y) \prod_{j=1...M} \sum_{Z_j} P(Z_j \mid Y) * P(X_j \mid Z_j)$$

Where

$$P(Y = 1) = \phi$$

$$P(Z_j \mid Y) = 1(Z = Y) * \lambda + 1(Z \neq Y) * (1 - \lambda)$$

$$P(X_j \mid Z_j) = N(X \mid \mu_{Z_j}, \sigma_{Z_j})$$

For  $P(Y, Z \mid X)$ 

$$P(Y, Z_{1...M} | X_{1}...M)$$

$$= \frac{P(Y, Z_{1...M}, X_{1}...M)}{P(X_{1}...M)}$$

$$= \frac{P(Y) \prod_{z} p(x_{j} | z_{j}) * p(z_{j} | y_{j})}{\sum_{Y} P(Y) \prod_{z} \sum_{Z} p(x_{j} | z_{j}) * p(z_{j} | y_{j})}$$

This is computable for similar reasons to the calculations above.

M step:

 $\mu, \sigma$  have very similar update equations as part A.

$$\phi = \frac{\sum_{N} P(Y_n \mid X_{n,1...M})}{N}$$

$$\lambda = \frac{\sum_{i,j} P(Y_i = 0, Z_{ij} = 0 \mid X_{n,1...M}) + P(Y_i = 1, Z_{ij} = 1 \mid X_{n,1...M})}{M * N}$$
